SECTION: 2

WEEK: 2

AIM: Implementation of A* algorithm using Parent Child.

DESCRIPTION: The A* algorithm is an informed search algorithm used for finding the shortest path from a start node to a goal node. It combines the advantages of Dijkstra's Algorithm and Greedy Best-First Search by using the function:

$$f(n)=g(n)+h(n)$$

In the A* algorithm, each node has a parent-child relationship that helps in reconstructing the optimal path once the goal is reached.

When the goal node is reached, we trace back from the goal to the start node using parent pointers to extract the shortest path

where:

- **g(n):** Cost from the start node to the current node.
- **h(n):** Heuristic (estimated) cost from the current node to the goal.
- **Parent Node:** The node from which we arrived at the current node.
- **Child Node:** The next node that can be explored from the current node.

CODE:

```
def astaralgo(start_node, stop_node):  
    open_set = set([start_node])  
    closed_set = set()  
  
    g = {}  
    parents = {}  
  
    g[start_node] = 0  
    parents[start_node] = start_node
```

```

while len(open_set) > 0:
    n = None

    for v in open_set:
        if n is None or g[v] + heuristic(v) < g[n] + heuristic(n):
            n = v

    if n == stop_node or Graph_nodes.get(n) is None:
        pass
    else:
        for (m, weight) in get_neighbors(n):
            if m not in open_set and m not in closed_set:
                open_set.add(m)
                parents[m] = n
                g[m] = g[n] + weight
            else:
                if g[m] > g[n] + weight:
                    g[m] = g[n] + weight
                    parents[m] = n

            if m in closed_set:
                closed_set.remove(m)
                open_set.add(m)

    if n is None:
        print("Path does not exist!")
        return None

    if n == stop_node:
        path = []
        total_path_length = 0 # Variable to track the total path length
        while parents[n] != n:
            path.append(n)
            total_path_length += next(weight for m, weight in
get_neighbors(parents[n]) if m == n)
            n = parents[n]

```

```

'F': [('G', 9)],
}
```

```
# Run the algorithm
astaralgo('S', 'G')
```

OUTPUT:

```
➡ Goal reached!
Total cost for the shortest path: 17
Path: S -> C -> D -> E -> G
```

AIM: Implementation of A* algorithm using the Grid.

DESCRIPTION: In grid-based pathfinding, the A* algorithm is commonly used to navigate through a 2D environment, such as a maze or a map with obstacles.

Steps in A for a Grid*

1. Define the grid (matrix where 0 = walkable, 1 = obstacle).
2. Set start and goal positions.
3. Expand nodes in four directions (up, down, left, right).
4. Calculate $g(n)$, $h(n)$, and $f(n)$ for each node.
5. Use a priority queue (heap) to always expand the node with the lowest $f(n)$.
6. Continue until the goal is reached.
7. Backtrack using the parent pointers to reconstruct the path.

CODE:

```
import math
import heapq
```

```
# Define the Cell class
```

```
class Cell:
    def __init__(self):
        self.parent_i = 0 # Parent cell's row index
        self.parent_j = 0 # Parent cell's column index
        self.f = float('inf') # Total cost of the cell (g + h)

ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING LAB

TM

NAME: M KAUSHIK

SAI

ROLL: 160122733118

BRANCH: CSE

SECTION: 2

WEEK: 1

AIM: Identification and Installation of python environment towards the artificial intelligence and machine learning, installing python modules/Packages Import scikitlearn, keras etc.

DESCRIPTION: Artificial Intelligence and Machine Learning require a robust programming environment equipped with specialized libraries and tools. Python is the most widely used language for AI/ML due to its simplicity and extensive library support. This experiment focuses on:

- Installing Python and setting up an environment (Anaconda, Virtual Environment, or Google Colab).
- Installing essential AI/ML packages like numpy, pandas, matplotlib, scikit-learn, keras, and tensorflow.
- Verifying the successful installation of these packages.

PROCEDURE:

Step 1: Checking Python Installation

1. Open the terminal (Command Prompt or Anaconda Prompt).
2. Type the following command to check if Python is installed:
`python --version`
3. If Python is not installed, download and install it from [Python's official website](#).

Step 2: Setting Up a Virtual Environment (Optional but Recommended)

1. Create a new virtual environment:
2. Activate the virtual environment:

```
python -m venv aiml_env
```

- Windows:

```
aiml_env\Scripts\activate
```

- Mac/Linux:

```
source aml_env/bin/activate
```

Step 3: Installing Essential Python Modules

Use pip to install AI/ML packages:

```
pip install numpy pandas matplotlib scikit-learn keras tensorflow
```

Step 4: Importing and Verifying Installed Packages

Create a Python script (verify_installation.py) and run the following code:

```
import numpy as np
import pandas as pd
import sklearn
import keras
import tensorflow as tf
```

```
print("NumPy Version:", np.__version__)
```

```
print("Pandas Version:", pd.__version__)
```

```
print("Scikit-learn Version:", sklearn.__version__)
```

```
print("Keras Version:", keras.__version__)
```

```
print("TensorFlow Version:", tf.__version__)
```

OUTPUT:

```
NumPy Version: 1.26.4
Pandas Version: 2.2.2
Scikit-learn Version: 1.6.1
Keras Version: 3.8.0
TensorFlow Version: 2.18.0
```
